1. Introduction

1.1 Purpose

Specifies the software requirements for the **Chaitanya Multi Speciality Hospital Management System (HMS)** client-side web application.

1.2 Scope

- **Public Website (index.html):** Patient-facing portal, doctor directory search, and appointment booking simulation.
- **Admin Dashboard (dashboard.html):** Management panel for beds, patients, inventory stock, waste logs, and staff shifts.
- **Architecture Constraint:** Static frontend implementation with in-memory state simulation; no database backend required.

1.3 Definitions & Acronyms

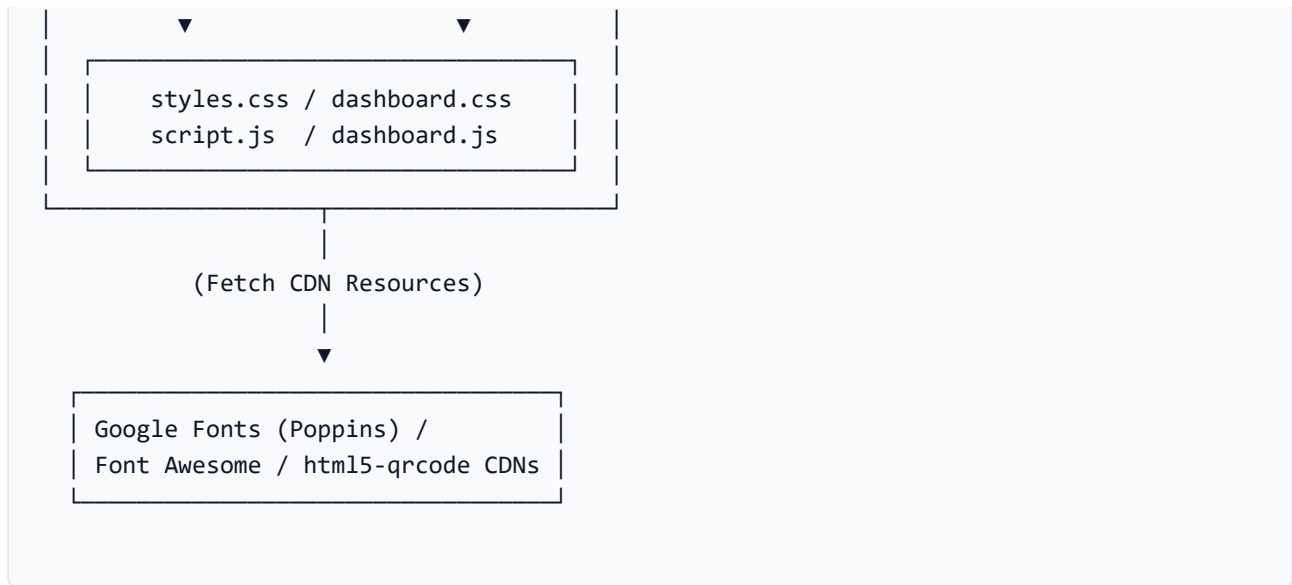

- **HMS:** Hospital Management System.
- **CRUD:** Create, Read, Update, Delete.
- **CDN:** Content Delivery Network (Font Awesome, Google Fonts).

2. Overall Description

2.1 System Architecture

The application is a self-contained static client-side web application:

2.2 Operating Environment

- **Client:** Web browsers (Chrome, Edge, Safari, Firefox) on desktop or mobile.
- **Server:** Local HTTP Server (python -m http.server 8000) for testing camera-based barcode scanning.

2.3 Constraints & Assumptions

- Static data state resets on page reload.
- Requires internet access for loading external icons, fonts, and scripts from CDNs.
- Requires browser camera permissions for the barcode scanner.

3. System Features & Functional Requirements

- **3.1 Public Navigation & About:** Navbar with smooth scroll links and counts for beds, doctors, and patients.
- **3.2 Services Grid:** Dynamic view of departments (Cardiology, Neurology, Pediatrics, Orthopedics, Ophthalmology, Dentistry).
- **3.3 Doctor Directory:** Filterable search interface categorizing active doctors by department.
- **3.4 Appointment Booking:** Input form (Name, Email, Phone, Date, Department) with simulated submission loader and toast confirmation.
- **3.5 Admin Dashboard Panel:** Sidebar navigation with key analytics cards (Beds, Stock Alerts, Waste stats, Staff counts).
- **3.6 Patient & Bed Management:** Bed assignment matrix with visual status tracking, patient search, and admission modal form.
- **3.7 Waste Logger:** Biomedical (Red), Sharps (Orange), and General (Gray) waste logging with live updating charts.
- **3.8 Stock Inventory:** Medicine and supply catalog with automatic low-level highlights and restock triggers.
- **3.9 Barcode Scanner:** Integrated camera/image scanner using html5-qrcode to auto-fill stock intake and details.
- **3.10 Staff Directory:** Staff listing by shifts (Morning, Evening, Night) and operational roles.

4. Technology Summary

Category	Technology
Structure	HTML5
Styling	CSS3, CSS Variables, Flexbox, Grid
Logic	Vanilla JavaScript (ES6+)
Animations	CSS Keyframes & Transitions, IntersectionObserver API

Category	Technology
CDNs Used	Font Awesome v6.4.0, Google Fonts (Poppins), html5-qrcode v2.3.8

5. Non-Functional Requirements

- **Performance:** Page load under 3 seconds; search/filtering reaction in under 100ms.
- **Security:** Clean, static code with no hardcoded credentials; zero permanent user data retention.
- **Usability:** Premium modern design using Poppins typography, accessibility-friendly forms, and ESC-key modal closing.
- **Responsiveness:** Fluid grid layout supporting mobile view (collapsible sidebar) to wide desktop screens.

6. Use Case Descriptions

- **UC-01: Book Appointment:** Patient fills public form -> Clicks book -> Simulated loading state -> Toast success notification.
- **UC-02: Admit Patient:** Staff opens patient modal -> Fills details -> Submits -> Bed matrix updates and counts increment.
- **UC-03: Barcode Scan:** Staff scans medicine bar/QR code -> System matches item in lookup -> Auto-fills the inventory form.
- **UC-04: Monitor Stock:** Dashboard highlights low stock items in red, warning staff to initiate a restock process.
